While shoppers gear up for the upcoming First Monday sales, paleontologists are unlocking exclusive insights from the latest Saurophaganax skeleton reveal. This newly displayed fossil set promises a deep dive into the anatomy and lifestyle of one of the most formidable theropods of the Late Jurassic. Saurophaganax, meaning “lizard hunter,” is a large tyrannosaurid that roamed the North American interior around 150 million years ago. Known for its massive skull and powerful jaw, this predator filled a top predator niche long before Tyrannosaurus rex dominated the horizon. The recent assemblage includes bones that were excavated from the famous Peterson Quarry in the Black Hills. The skeleton, now displayed in the Smithsonian’s American Museum of Natural History, offers a near-complete set of postcranial elements—spines, ribs, and limb bones—that were previously missing from most reconstructions. Analysis of the vertebrae suggests a surprisingly agile build, contradicting the traditional view of a sluggish, lumbering predator. The joint articulations between the thoracic vertebrae display a greater range of motion than previously thought, hinting at a more dynamic hunting style.
